Process & Decision Documentation

Entry Header

Name: Giang Tran

Role(s): Sole Coder

Primary responsibility for this work: All work completed for Week 6 Side Quest

Goal of Work Session

Customize an existing game by replacing its visual and audio assets with free resources found online. Swap out the sprite sheets for the player, leaf, and enemy characters, change the tileset to redesign the level's appearance, and add sound effects for jumping, attacking, taking damage, collecting objects, plus a looping background music track.

Tools, Resources, or Inputs Used

- Claude Sonnet 4.6 — prompt ideation and technical consultation
- Claude Code Opus 4.6 — implementation
- Week 6 Lecture Notes
- Existing Week 6 terrain codebase

GenAI Documentation

Purpose of Use: Debugging asset integration, file path resolution, sprite sheet frame counting, tilemap design, and audio file replacement workflow optimization.

Summary of Interaction: Claude Code analyzed sprite sheet dimensions, automated file copying/resizing, updated animation frame counts in game config files, redesigned the tilemap with swamp theme assets, and rewired audio paths. Claude Sonnet provided initial prompt structure for each task phase.

Human Decision Point(s):

- Selected which specific swamp tiles to use for ground/platforms based on visual coherence
- Decided to reuse certain sounds (descent-whoosh for both hit/die, riser-wildfire for leaf/win) for consistency

- Chose to rename audio files to descriptive names (ascent-braam.wav vs generic jump.wav) for better project organization
- Manually verified tilemap row lengths were exactly 40 characters when Claude Code's initial layout had inconsistencies

Integrity & Verification Note: Manually tested game after each major change (player sprites, enemy sprites, leaf sprite, tileset, audio). Verified frame counts matched actual sprite sheet dimensions using pixel measurements. Cross-referenced animation mappings between AssetLoader.js, entity files, and tuning.json to ensure consistency.

Scope of GenAI Use: GenAI did not: design the tilemap layout (human-designed based on platforming gameplay needs), select which specific tile images to assign to which tile codes, decide final audio-to-event mappings, or test gameplay functionality.

Limitations or Misfires:

- Initial tilemap rows were 39 chars instead of 40, required manual correction
- Claude Code initially tried to use PIL library (not installed), had to pivot to raw Python struct parsing for sprite dimensions
- Blood_Charge sprites were in different folder (Countess_Vampire vs Vampire_Girl), required additional file path correction

Summary of Process (Human + Tool)

Started by uploading sprite sheets and using Claude Code to measure frame counts and dimensions. Iteratively replaced player, enemy, and leaf sprites by copying files, resizing to 32px frame height, and updating AssetLoader.js animation definitions. Redesigned level tilemap by selecting appropriate swamp tiles from the asset pack and manually arranging them for platforming flow. Replaced audio by copying MP3 files to sfx folder, renaming to descriptive names, and updating main.js sound loading paths. Tested after each major change to verify animations played correctly and sounds triggered on proper game events.

Decision Points & Trade-offs

<u>Tilemap Design:</u> Chose to create a more open, platforming-focused layout versus dense obstacle course. Used fewer wall tiles and more floating platforms to showcase new swamp background layers. Trade-off: easier difficulty but better visual showcase of new assets.

Audio Reuse: Decided to reuse descent-whoosh for both enemy-hit and player-death, and riser-wildfire for both leaf-collection and level-win. Trade-off: fewer unique sounds but maintains thematic consistency (descending = defeat, rising = success).

Verification & Judgement

Playtested game after each asset swap to ensure: sprite animations looped correctly at appropriate speeds, collision detection still worked with new character dimensions, background parallax layers rendered in correct depth order, and audio triggered on correct game events without overwhelming music track. Compared final result against assignment rubric to confirm all required elements (player/enemy/leaf sprites, tileset, 4+ sound effects, looping music, credits in README) were implemented.

Limitations, Dead Ends, or Open Questions

- Blood_Charge animation sprites defined but not integrated into enemy AI attack states (would require additional AI state machine modification)
- Attack_2 and Attack_3 player sprites copied to assets but not wired to combat system (game only uses Attack_1)
- Music volume balancing is hardcoded (musicVolume: 0.4, sfxVolume: 0.7) rather than user-adjustable
- Some sprite frames counts in original prompt differed from actual pixel measurements, had to measure manually to get accurate counts

Appendix

Replace the player character sprites in this game with my custom sprite sheets. The sprite sheets are located in the uploads folder and include: - Attack_1.png, Attack_2.png, Attack_3.png (attack animations) - Dead.png (death	Let me explore the project structure and the uploaded sprite sheets at the same time. 🟠 Searched for 1 pattern, read 3 files (ctrl+o to expand) 🟠 Found the sprites in your Downloads. Let me look at all available character folders and inspect the game's player entity and asset loader. 🟠 Read 2 files (ctrl+o to expand) 🟠 Now let me look at the AssetLoader and any data/config

animation) - Hurt.png (hurt/damage animation) - Idle.png (idle/standing animation) - Jump.png (jump animation) - Protect.png (blocking/defending animation) - Run.png (running animation) - Walk.png (walking animation) Each sprite sheet is a horizontal strip with multiple frames. Please: 1. Find where the player sprites are currently loaded/defined 2. Replace them with my sprite sheets from /mnt/user-data/uploads / 3. Update the frame counts for each animation based on the actual frames in my sheets 4. Adjust the sprite dimensions if needed to match my character size 5. Make sure all animations work smoothly with the existing game logic	files that define sprite dimensions and animation frames. ⏺ Read 2 files (ctrl+o to expand) ⏺ Bash(python3 -c " from PIL import Image…) └ Error: Exit code 1 Traceback (most recent call last): File "<string>", line 2, in <module> ModuleNotFoundError: No module named 'PIL' ⏺ Bash(python3 -c " import struct, zlib, os…) └ Attack_1.png: 640x128 (frames=5) Attack_2.png: 512x128 (frames=4) Attack_3.png: 256x128 (frames=2) … +7 lines (ctrl+o to expand) ⏺ Now let me check how the game package is assembled and view the levels.json. ⏺ Read 1 file (ctrl+o to expand) ⏺ Bash(python3 -c " import struct, os…) └ Attack_1.png: 768x128 (frames=6) Attack_2.png: 384x128 (frames=3) Attack_3.png: 128x128 (frames=1) … +11 lines (ctrl+o to expand) ⏺ Now let me check the LevelLoader to understand the tiles config and how tuning.json player animations are read. ⏺ Read 1 file (ctrl+o to expand) ⏺ Now let me check the Converted_Vampire folder for Protect.png, and look at the Level.js for attack logic: ⏺ Searched for 1 pattern (ctrl+o to expand)

	⏺ The Converted_Vampire folder has Protect.png — this matches the user's list exactly! Let me check the PlayerController: ⏺ Read 2 files (ctrl+o to expand) ⏺ Now I have everything I need. The Converted_Vampire folder matches your list perfectly (has Protect.png). The sprites are 128×128px per frame. I'll resize them to 32×32 frames (to match the game's world scale), copy to assets/, and wire them up. Here's what I'll do: 1. Resize all 10 sprites from 128px → 32px height via sips → assets/player_*.png 2. Update AssetLoader.js — new defaultPlayerAnis() with per-file img paths & frame counts 3. Fix a frame-index off-by-one in PlayerEntity.js (Hurt has 1 frame, old code used frame index 1) ⏺ Bash(SRC="/Users/giangtran/Downloads/craftpix-net-506778-free- vampire-pixel-art-sprite-sheets/Converted_Vampire" DST="/Users/giangtran/Documents/GitHub/ggiangt_sideq…) └ /Users/giangtran/Downloads/craftpix-net-506778-free-vampire-pixel-art-sprite-sheets/Converted_Vampire/Attack_1.png … +34 lines (ctrl+o to expand) ⏺ All 10 sprites resized and copied. Now update AssetLoader.js: ⏺ Update(~/Documents/GitHub/ggiangt_sidequest_W6/src/AssetLoader .js)

└ Added 1 line, removed 1 line

```
20    // IMPORTANT:
21    // loadImage() is "preload-safe" only if p5 i
      s actually tracking it inside preload().
22    // To make this robust even if your boot flow
       uses async/await, we wrap loadImage in a Promi
      se.
23 -  const playerImg = await loadImageAsync("asset
     -s/foxSpriteSheet.png");
23 +  const playerImg = await loadImageAsync("asset
     +s/player_Idle.png");
24    const boarImg = await loadImageAsync("assets/
      boarSpriteSheet.png");
25    const leafImg = await loadImageAsync("assets/
      leafSpriteSheet.png");
26    const fireImg = await loadImageAsync("assets/
      fireSpriteSheet.png");
```

⏺ Now update the buildAnis call for the player — remove the
spriteSheet injection since each animation now provides its own img:

⏺ Update(~/Documents/GitHub/ggiangt_sidequest_W6/src/AssetLoader
.js)

└ Added 2 lines, removed 3 lines

```
42    // ---- anis ----
43    // Prefer tuning-driven animations if present
      , else fallback to monolith defaults.
44    // ALSO: inject a spriteSheet reference by de
      fault so addAnis never tries to load "undefined
      ".
45 -  let playerAnis = buildAnis(tuningDoc?.player?
     -.animations, defaultPlayerAnis(), {
46 -    spriteSheet: playerImg,
47 -  });
45 +  // Each player animation has its own img, so
     +no global spriteSheet injection needed.
46 +  let playerAnis = buildAnis(tuningDoc?.player?
     +.animations, defaultPlayerAnis(), {});
47
48    let boarAnis = buildAnis(tuningDoc?.boar?.ani
```

```
mations, defaultBoarAnis(), {
49      spriteSheet: boarImg,
```

🔶 Now update defaultPlayerAnis() with the new per-file sprite
sheets and correct frame counts:

🔶 Update(~/Documents/GitHub/ggiangt_sidequest_W6/src/AssetLoader
.js)
└ Added 9 lines, removed 7 lines

```
128    return out;
129  }
130
131 -// --- fallback anis (from your monolith) ---
131 +// --- fallback anis (Converted_Vampire sprite
    + sheets) ---
132  function defaultPlayerAnis() {
133    return {
134 -    idle: { row: 0, frames: 4, frameDelay: 10
    -},
135 -    run: { row: 1, frames: 4, frameDelay: 3 },
136 -    jump: { row: 2, frames: 3, frameDelay: Inf
    -inity, frame: 0 },
137 -    attack: { row: 3, frames: 6, frameDelay: 2
    - },
138 -    hurtPose: { row: 5, frames: 4, frameDelay:
    - Infinity },
139 -    death: { row: 5, frames: 4, frameDelay: 16
    - },
134 +    idle:      { img: "assets/player_Idle.png"
    +,     frames: 5, frameDelay: 10 },
135 +    run:       { img: "assets/player_Run.png",
    +      frames: 8, frameDelay: 3  },
136 +    walk:      { img: "assets/player_Walk.png"
    +,     frames: 8, frameDelay: 5  },
137 +    jump:      { img: "assets/player_Jump.png"
    +,     frames: 7, frameDelay: Infinity, frame:
    +0 },
138 +    attack:    { img: "assets/player_Attack_1.
    +png", frames: 5, frameDelay: 2  },
139 +    hurtPose:  { img: "assets/player_Hurt.png"
    +,     frames: 1, frameDelay: Infinity, frame:
```

```
+0 },
140 +    death:     { img: "assets/player_Dead.png"
+,     frames: 8, frameDelay: 16 },
141 +    protect:   { img: "assets/player_Protect.p
+ng",  frames: 2, frameDelay: 8  },
142    };
143  }
144
```

⏺ Now fix the off-by-one frame index in PlayerEntity.js — Hurt.png has only 1 frame (index 0), but the code was requesting frame 1:

⏺ Update(~/Documents/GitHub/ggiangt_sidequest_W6/src/entities/Pl
ayerEntity.js)
└ Added 1 line, removed 1 line

```
265      }
266
267      if (this.knockTimer > 0 || this.pendingDea
th) {
268 -      this._setAniFrame("hurtPose", 1);
268 +      this._setAniFrame("hurtPose", 0);
269        return;
270      }
271
```

⏺ Let me do a quick sanity check on the final state of the changed files:

⏺ Read 1 file (ctrl+o to expand)

⏺ Everything looks correct. Let me verify the assets are all in
place:

⏺ Read 1 file (ctrl+o to expand)

⏺ All done. Here's a summary of every change made:

Sprites found & used: Converted_Vampire from your Downloads —

	it's the only folder that has all your listed sheets including Protect.png. What was changed: File: assets/player_*.png Change: 10 new files — each sheet resized from 128px → 32px frame height via sips to match the game's world scale File: src/AssetLoader.js Change: playerImg now loads player_Idle.png (used as p5play fallback); defaultPlayerAnis() replaced with per-file img + correct frame counts; removed the spriteSheet injection for player anims (each animation now carries its own image) File: src/entities/PlayerEntity.js Change: hurtPose frame index changed 1 → 0 (Hurt.png has only 1 frame at index 0) Animation mapping: Game state: idle Sprite file: player_Idle.png Frames: 5 Notes: delay 10 Game state: run Sprite file: player_Run.png Frames: 8 Notes: delay 3

	Game state: walk Sprite file: player_Walk.png Frames: 8 Notes: delay 5 (defined but unused by current logic) Game state: jump Sprite file: player_Jump.png Frames: 7 Notes: held at frame 0/1 for up/down Game state: attack Sprite file: player_Attack_1.png Frames: 5 Notes: delay 2 Game state: hurt/knockback Sprite file: player_Hurt.png Frames: 1 Notes: held at frame 0 Game state: death Sprite file: player_Dead.png Frames: 8 Notes: delay 16, holds last frame Game state: protect Sprite file: player_Protect.png Frames: 2 Notes: defined for future use The Attack_2.png and Attack_3.png are in assets/ and available to wire up to additional attack combos whenever you want them.

I need to replace the player character in this game with my custom sprite sheets. Here's what I have: Sprite sheets in /mnt/user-data/uploads/: - Idle.png (5 frames - standing idle) - Walk.png (8 frames - walking cycle) - Run.png (8 frames - running cycle) - Jump.png (7 frames - jump sequence) - Attack_1.png (5 frames - first attack) - Attack_2.png (3 frames - second attack) - Attack_3.png (4 frames - third attack) - Hurt.png (1 frame - taking damage) - Protect.png (2 frames - blocking/defending) - Dead.png (7 frames - death animation) Please update the code to use these sprites, ensuring the frame counts and dimensions are correct for smooth animation.	Let me first check the actual frame counts in the Vampire_Girl folder and review the enemy entity code. ⏺ Read 1 file (ctrl+o to expand) ⏺ Let me check how the boar group is created in Level.js and how boarImg is wired to sprites: ⏺ Read 1 file (ctrl+o to expand) ⏺ Now let me look at the BoarSystem and TileBuilder to see exactly how the boar group/spriteSheet is set up: ⏺ Searched for 1 pattern, read 1 file (ctrl+o to expand) ⏺ Now I have a complete picture. The boar AI uses exactly 3 animations: run, throwPose (stagger/knockback), and death. A few notes before I start: - Blood_Charge files are not in the Vampire_Girl folder — they're in Countess_Vampire (different character). I'll copy them from there and add them to the animation defs, but since the boar AI has no attack state, I'll wire them as attackCharge for future use without changing AI logic. - Actual frame counts (measured from pixels) differ from your stated counts. The images are 128px tall — I'll use the real measurements. - BoarSystem.js calls safeAssignSpriteSheet(e, boarImg) in several init paths. Since each animation will carry its own img, that global assignment becomes an inert fallback. ⏺ Bash(SRC="/Users/giangtran/Downloads/craftpix-net-506778-free- vampire-pixel-art-sprite-sheets/Vampire_Girl"

	SRC2="/Users/giangtran/Downloads/craftpix-net-506778-free…) └ /Users/giangtran/Downloads/craftpix-net-506778-free-vampire-pixel-art-sprite-sheets/Vampire_Girl/Run.png /Users/giangtran/Documents/GitHub/ggiangt_sidequest_ … +48 lines (ctrl+o to expand) ⏺ All 14 sprites copied. Now update AssetLoader.js — change boarImg and replace defaultBoarAnis(): ⏺ Update(~/Documents/GitHub/ggiangt_sidequest_W6/src/AssetLoader .js) └ Added 1 line, removed 1 line 21 // loadImage() is "preload-safe" only if p5 is actually tracking it inside preload(). 22 // To make this robust even if your boot flow uses async/await, we wrap loadImage in a Promise. 23 const playerImg = await loadImageAsync("assets/player_Idle.png"); 24 - const boarImg = await loadImageAsync("assets/-boarSpriteSheet.png"); 24 + const boarImg = await loadImageAsync("assets/+enemy_Run.png"); 25 const leafImg = await loadImageAsync("assets/leafSpriteSheet.png"); 26 const fireImg = await loadImageAsync("assets/fireSpriteSheet.png"); 27 ⏺ Update(~/Documents/GitHub/ggiangt_sidequest_W6/src/AssetLoader .js) └ Added 2 lines, removed 3 lines 45 // Each player animation has its own img, so no global spriteSheet injection needed.

```
46    let playerAnis = buildAnis(tuningDoc?.player?
    .animations, defaultPlayerAnis(), {});
47
48 -  let boarAnis = buildAnis(tuningDoc?.boar?.ani
   -mations, defaultBoarAnis(), {
49 -    spriteSheet: boarImg,
50 -  });
48 +  // Each enemy animation has its own img, so n
   +o global spriteSheet injection needed.
49 +  let boarAnis = buildAnis(tuningDoc?.boar?.ani
   +mations, defaultBoarAnis(), {});
50
51    // If tuning.json uses per-animation "img" fi
    elds (strings), preload them here and replace w
    ith p5.Images.
52    // This prevents runtime XHRs and avoids /und
    efined crashes.
```

⏺ Update(~/Documents/GitHub/ggiangt_sidequest_W6/src/AssetLoader
.js)
└ Added 20 lines, removed 3 lines

```
141    };
142  }
143
144 +// --- fallback anis (Vampire_Girl sprite shee
    +ts) ---
145 +// Active AI states:   run | throwPose | death
146 +// Defined but unused: idle | walk | jump | at
    +tack1-4 | bloodCharge1-4 (ready for AI expansi
    +on)
147  function defaultBoarAnis() {
148    return {
146 -    run: { row: 1, frames: 4, frameDelay: 3 },
147 -    throwPose: { row: 4, frames: 1, frameDelay
    -: Infinity, frame: 0 },
148 -    death: { row: 5, frames: 4, frameDelay: 16
    - },
149 +    // ---- AI-driven animations ----
150 +    run:       { img: "assets/enemy_Run.png",
    + frames: 6, frameDelay: 3 },
151 +    throwPose: { img: "assets/enemy_Hurt.png",
    + frames: 2, frameDelay: Infinity, frame: 0 },
```

```
152 +    death:     { img: "assets/enemy_Dead.png",
   + frames: 10, frameDelay: 12 },
153 +
154 +    // ---- Defined but not yet triggered by A
   +I ----
155 +    idle:        { img: "assets/enemy_Idle.pn
   +g",          frames: 5, frameDelay: 10 },
156 +    walk:        { img: "assets/enemy_Walk.pn
   +g",          frames: 6, frameDelay: 5  },
157 +    jump:        { img: "assets/enemy_Jump.pn
   +g",          frames: 6, frameDelay: Infinity,
   + frame: 0 },
158 +    attack1:     { img: "assets/enemy_Attack_
   +1.png",      frames: 5, frameDelay: 2  },
159 +    attack2:     { img: "assets/enemy_Attack_
   +2.png",      frames: 4, frameDelay: 2  },
160 +    attack3:     { img: "assets/enemy_Attack_
   +3.png",      frames: 2, frameDelay: 3  },
161 +    attack4:     { img: "assets/enemy_Attack_
   +4.png",      frames: 5, frameDelay: 2  },
162 +    bloodCharge1: { img: "assets/enemy_Blood_C
   +harge_1.png", frames: 4, frameDelay: 4  },
163 +    bloodCharge2: { img: "assets/enemy_Blood_C
   +harge_2.png", frames: 4, frameDelay: 4  },
164 +    bloodCharge3: { img: "assets/enemy_Blood_C
   +harge_3.png", frames: 4, frameDelay: 4  },
165 +    bloodCharge4: { img: "assets/enemy_Blood_C
   +harge_4.png", frames: 5, frameDelay: 4  },
166    };
167  }
168
```

⏺ Now let me verify the final state of the relevant section of AssetLoader looks correct:

⏺ Read 1 file (ctrl+o to expand)

⏺ Everything looks correct. Let me do a final check on all the
 new enemy assets:

⏺ Bash(python3 -c "
 import struct, os…)
 └ enemy_Attack_1.png: 160x32 (frames=5)

enemy_Attack_2.png: 128x32 (frames=4)
enemy_Attack_3.png: 64x32 (frames=2)
… +11 lines (ctrl+o to expand)

⏺ All 14 sprites are in place with the correct dimensions. Here's a full summary:

What was changed:

File: assets/enemy_*.png
Change: 14 new files — all sprites resized to 32px frame height
(Blood_Charge kept at 24px since their source is 48px, a different scale)

File: src/AssetLoader.js
Change: boarImg now points to enemy_Run.png; defaultBoarAnis()

replaced with 12 per-file animations; removed the global spriteSheet injection for enemy anims

Animation mapping:

AI state	Sprite	Frames	Notes
run	enemy_Run.png	6	patrol movement
throwPose	enemy_Hurt.png	2	held at frame 0 — knockback stagger + pre-death

death	enemy_Dead.png	10	12-frame delay, holds on last frame then fades out	

Defined and ready, not yet AI-triggered:
idle, walk, jump, attack1–attack4, bloodCharge1–bloodCharge4

Blood_Charge note: These files don't exist in the Vampire_Girl folder — they're from the Countess_Vampire character (different art style, 48px source height). They're wired in as bloodCharge1–bloodCharge4 and can be triggered by adding an attack state to the boar AI whenever you're ready (e.g. level._setAniSafe(e, "bloodCharge1") before an attack sequence).

Your stated frame counts vs. actual pixel measurements also differed (e.g. you listed Dead as 7 frames but the sheet is 1280px ÷ 128px = 10 frames). The code uses the measured values.

✻ Crunched for 2m 52s

❯ Replace the leaf character sprites in this game with my custom Owlet Monster sprite sheet. The sprite sheet is located at: downloads/craftpix-net-622999-free-pixel-art-tiny-hero-sprites/owlet_monster/

- Owlet_Monster_Walk_6.png (6 frames - walking animation)

Please:
1. Find where the leaf character sprites are currently loaded in the code

	2. Update the sprite path to: downloads/craftpix-net-622999-fre e-pixel-art-tiny-hero-sprites/owlet_monster/ 3. Update the frame count to 6 frames for the walking animation 4. Adjust sprite dimensions if needed to match the Owlet Monster size 5. If the leaf character has other animations (idle, jump, attack, etc.), check if there are corresponding Owlet Monster animations in the same folder, or use the walk animation as a placeholder 6. Ensure the animation plays smoothly with the existing game logic for the leaf character ⏺ Let me check the actual sprite sheet and the leaf entity code simultaneously. ⏺ Searched for 2 patterns (ctrl+o to expand) ⏺ Found it at 2 Owlet_Monster/. Let me measure the sprite dimensions: └ Invalid tool parameters ⏺ Searched for 1 pattern (ctrl+o to expand) ⏺ The Owlet Monster sprites are already 32×32 per frame — a perfect match for the game's world scale. No resizing needed. The leaf only uses one animation (idle), so Walk_6 maps directly to it. Changes needed: 1. Copy Owlet_Monster_Walk_6.png → assets/ 2. AssetLoader.js — update leafImg path 3. TileBuilder.js — update frame count 5 → 6 4. Leaf.js makeGroup — update frame count 5 → 6 Let me also check TileBuilder.js before editing: ⏺ Read 1 file (ctrl+o to expand)

	⏺ Now make all three edits: ⏺ Update(~/Documents/GitHub/ggiangt_sidequest_W6/src/entities/Leaf.js) └ Added 1 line, removed 1 line 69 g.spriteSheet = assets.leafImg; 70 71 // If you later move this into tuning.json, replace these literals. 72 - g.addAnis({ idle: { w: 32, h: 32, row: 0, frames: 5 } }); 72 + g.addAnis({ idle: { w: 32, h: 32, row: 0, frames: 6 } }); 73 74 g.w = 10; 75 g.h = 6; ⏺ Done. Here's the summary: --- What was changed: File: assets/leaf_Owlet_Walk.png Change: New file — copied directly from 2 Owlet_Monster/Owlet_Monster_Walk_6.png (no resize needed, already 192×32 = 6 frames of 32×32) --- File: src/AssetLoader.js Change: leafImg path changed from leafSpriteSheet.png → leaf_Owlet_Walk.png --- File: src/world/TileBuilder.js Change: frames: 5 → frames: 6 in the leaf group addAnis call ---

	— File: src/entities/Leaf.js Change: frames: 5 → frames: 6 in makeGroup (mirrors TileBuilder for consistency) Why no other changes were needed: The Owlet Monster sprites are natively 32×32 per frame — the exact same size the game already used for the leaf. The w: 32, h: 32 in addAnis, the collider dimensions (w: 10, h: 6), and the visual offsets (offset.x: 2, offset.y: -4) all remain valid. Other Owlet animations available (not used since the collectible only needs idle): Idle_4, Run_6, Jump_8, Attack1_4, Attack2_6, Death_8, Hurt_4 — all at 32×32 per frame if you ever want to give the collectible an idle-specific animation or a "collected" effect.
Replace the enemy character sprites in this game with my custom sprite sheets. The sprite sheets are located in /mnt/user-data/uploads / and include: - Attack_1.png (6 frames - first attack animation) - Attack_2.png (3 frames - second attack animation) - Attack_3.png (1 frame - third attack animation) - Attack_4.png (6 frames - fourth attack animation) - Blood_Charge_1.png (3 frames - blood charge effect) -	Explore(Explore swamp tileset and game structure) └ Done (10 tool uses · 35.8k tokens · 7m 58s) (ctrl+o to expand) ⏺ Let me view the swamp tileset to understand the tile layout before making decisions. ⏺ Read 1 file (ctrl+o to expand) ⏺ Let me view key individual tiles to identify which ones to use for each role: ⏺ Read 3 files (ctrl+o to expand) ⏺ Good. Now I have enough tile knowledge. Let me read the full levels.json and a couple more background layers before building everything: ⏺ Read 2 files (ctrl+o to expand)

Blood_Charge_2.png (3 frames - blood charge effect) - Blood_Charge_3.png (3 frames - blood charge effect) - Blood_Charge_4.png (4 frames - blood charge effect) - Dead.png (7 frames - death animation) - Hurt.png (2 frames - taking damage) - Idle.png (5 frames - idle/standing animation) - Jump.png (6 frames - jump animation) - Run.png (6 frames - running animation) - Walk.png (6 frames - walking animation) Please: 1. Find where the enemy sprites are currently loaded in the code 2. Replace them with my sprite sheets from /mnt/user-data/uploads / 3. Update the frame counts for each animation based on my sheets 4. Adjust sprite dimensions if needed to match my character 5. Ensure all animations play smoothly with the existing enemy AI and game logic 6. If there are special effects like Blood_Charge, integrate those into the appropriate attack animations	⏺ Now I have everything needed. Let me implement all changes at once: Tile assignments: - 'g' → Tile_02 (mossy top surface) - 'd' → Tile_04 (dark interior fill) - 'L' → Tile_01 (top-left moss corner) - 'R' → Tile_03 (top-right moss corner) - '[' → Tile_11 (left wall face) - ']' → Tile_13 (right wall face) Backgrounds: Layer 2 (far dark forest) → Layer 3 (closer trees) → Layer 5 (foreground swamp vegetation) ⏺ Bash(SRC="/Users/giangtran/Downloads/craftpix-net-672461-free- swamp-game-tileset-pixel-art" DST="/Users/giangtran/Documents/GitHub/ggiangt_sidequest_W 6/assets"…) └ All swamp assets copied. /Users/giangtran/Documents/GitHub/ggiangt_sidequest_W6 /assets/swamp_bg_far.png … +14 lines (ctrl+o to expand) ⏺ Now update AssetLoader.js to point to the swamp tile images: ⏺ Update(~/Documents/GitHub/ggiangt_sidequest_W6/src/AssetLoader .js) └ Added 6 lines, removed 6 lines 25 const leafImg = await loadImageAsync("assets/leaf_Owlet_Walk.png"); 26 const fireImg = await loadImageAsync("assets/fireSpriteSheet.png"); 27 28 - const groundTileImg = await loadImageAsync("a-ssets/groundTile.png");

```
29 -  const groundTileDeepImg = await loadImageAsyn
   -c("assets/groundTileDeep.png");
30 -  const platformLCImg = await loadImageAsync("a
   -ssets/platformLC.png");
31 -  const platformRCImg = await loadImageAsync("a
   -ssets/platformRC.png");
32 -  const wallLImg = await loadImageAsync("assets
   -/wallL.png");
33 -  const wallRImg = await loadImageAsync("assets
   -/wallR.png");
28 +  const groundTileImg = await loadImageAsync("a
   +ssets/swamp_ground.png");
29 +  const groundTileDeepImg = await loadImageAsyn
   +c("assets/swamp_ground_deep.png");
30 +  const platformLCImg = await loadImageAsync("a
   +ssets/swamp_platform_l.png");

	183 }
	184
	185 if (this.debug) {
	
	⏺ Now load all the sounds and start music in main.js:

	⏺ Update(~/Documents/GitHub/ggiangt_sidequest_W6/main.js) └ Added 17 lines 130 // (AudioContext may still be locked until the user clicks/presses a key.) 131 soundManager = new SoundManager(); 132 133 + // Sound effect assignments: 134 + // jump → ascent braam (upward cinematic +hit matches the player going up) 135 + // hurt → stab (sharp hit = taking damage +) 136 + // hit → stab (reused for enemy taking d +amage) 137 + // die → descent whoosh (falling/fading += death) 138 + // leaf → riser wildfire (positive upward + swell = collecting) 139 + // win → riser wildfire (same positive f +eel for level completion) 140 + soundManager.load("jump", "downloads/viralau +dio-ascent-braam-magma-brass-d-cinematic-trail +er-sound-effect-222269.mp3"); 141 + soundManager.load("hurt", "downloads/brvhrtz +-stab-f-01-brvhrtz-224599.mp3"); 142 + soundManager.load("hit", "downloads/brvhrtz +-stab-f-01-brvhrtz-224599.mp3"); 143 + soundManager.load("die", "downloads/viralau +dio-descent-whoosh-long-cinematic-sound-effect +-405921.mp3"); 144 + soundManager.load("leaf", "downloads/soundre +ality-riser-wildfire-285209.mp3"); 145 + soundManager.load("win", "downloads/soundre +ality-riser-wildfire-285209.mp3"); 146 + 147 + // Background music: drum loop plays continu +ously 148 + soundManager.loadMusic("downloads/solitaryma +ninblacksmok-solitarymaninblack-untitled-drum- +loop-for-you-to-use-118966.mp3"); 149 + 150 // --- Parallax layer defs (VIEW) ---

```
151    const defs = levelPkg.level?.view?.parallax
    ?? [];
152    parallaxLayers = defs
```

⏺ Now hook startMusic() into the audio unlock so the background
music begins on first user interaction:

⏺ Update(~/Documents/GitHub/ggiangt_sidequest_W6/main.js)
└ Added 1 line

```
65    if (audioUnlocked) return;
66    audioUnlocked = true;
67    if (typeof userStartAudio === "function") use
    rStartAudio();
68 +  soundManager?.startMusic();
69  }
70
71  // Prevent the browser from stealing keys (spac
    e/arrows) for scrolling.
```

⏺ Let me verify the final state of the key sections:

⏺ Searched for 1 pattern, read 1 file (ctrl+o to expand)

⏺ Everything is in place. Here's a summary of what was done:

Files copied to downloads/ in the project root (all 5 .mp3 files).

Sound assignments:

Event	Sound	File
player:jumped	Jump	ascent-braam — cinematic upward hit matches the player going up

	├──────────────────────┼──────────────┼──────────────────────┤ │ player:damaged + │ Hurt / │ stab-f-01 — sharp stab = │ │ boar:damaged │ Hit │ impact/damage │ ├──────────────────────┼──────────────┼──────────────────────┤ │ player:died │ Die │ descent-whoosh — long │ │ │ │ falling sound = death │ ├──────────────────────┼──────────────┼──────────────────────┤ │ leaf:collected + │ Collect │ riser-wildfire — │ │ level:won │ / Win │ positive upward swell │ ├──────────────────────┼──────────────┼──────────────────────┤ │ Background │ Music │ drum-loop — loops │ │ (looping) │ │ continuously │ └──────────────────────┴──────────────┴──────────────────────┘ Changes made: - src/SoundManager.js — added loadMusic() (loads + auto-loops), startMusic() (triggers on first user gesture), and setVolume() calls (SFX at 70%, music at 40% so it doesn't overpower) - src/Game.js — added player:jumped → sound.play("jump") wiring - main.js — loaded all 6 sound slots + background music track; unlockAudioOnce() now calls soundManager.startMusic() to start the drum loop on first click/keypress (required by browser autoplay policy)
Replace the existing sound files in the sfx	⏺ Searched for 2 patterns, read 1 file (ctrl+o to expand)

folder with my custom audio files from downloads/. Do NOT create a new downloads folder - copy and rename my audio files to replace the existing sound files in the sfx folder. Available sounds in downloads/: - brvhrtz-stab-f-01-brvhrtz-224599.mp3 - viralaudio-descent-whoosh-long-cinematic-sound-effect-405921.mp3 - viralaudio-ascent-braam-magma-brass-d-cinematic-trailer-sound-effect-222269.mp3 - soundreality-riser-wildfire-285209.mp3 - solitarymaninblacksmok-solitarymaninblack-untitled-drum-loop-for-you-to-use-118966.mp3 Please: 1. First, identify what the existing sound files in the sfx folder are named 2. Copy my audio files from downloads/ into the sfx folder, renaming them to match the existing filenames: - Replace the jumping sound with the ascent/whoosh sound - Replace the taking damage sound with the stab sound - Replace the collecting objects sound with one	⏺ The sfx folder appears empty or missing. Let me check the code to see what sound filenames are expected. ⏺ Read 2 files (ctrl+o to expand) ⏺ The sfx folder is at assets/sfx/ with these files: hitEnemy.wav, jump.wav, leafCollect.wav, music.wav, receiveDamage.wav. The current main.js already loads directly from downloads/, but the user wants the files in assets/sfx/. I'll copy the downloads files into assets/sfx/ with the correct names, replacing the old .wav files. Mapping: - jump.wav → ascent braam (going up = jump) - receiveDamage.wav → stab (sharp hit = taking damage) - hitEnemy.wav → descent whoosh (enemy falling after being hit) - leafCollect.wav → riser wildfire (positive swell = collecting) - music.wav → drum loop (background music) ⏺ Bash(cp "/Users/giangtran/Documents/GitHub/ggiangt_sidequest_W 6/downloads/viralaudio-ascent-braam-magma-brass-d-cinemati c-trailer-sound-effect-222269.mp3" "/Users/gi…) └ Done ⏺ Read 1 file (ctrl+o to expand) ⏺ Done. All 5 files have been replaced in assets/sfx/: ┌── │ File │ Replaced with │ ├── └

of the riser/braam sounds - Replace the background music with the drum loop 3. Use your judgment to match each of my sounds to the appropriate existing sound file based on what makes sense 4. Do NOT change any code - just replace the actual audio files in the sfx folder 5. Delete the downloads folder reference if one was created The goal is to swap out the audio files themselves, not change the code paths.

```
│ jump.wav          │ ascent braam (cinematic upward hit)  │
├──────────────────────────────┼──────────────────────────────
──────────────────────────────┤
│ receiveDamage.wav │ stab (sharp hit for taking damage)
│
├──────────────────────────────┼──────────────────────────────
──────────────────────────────┤
│ hitEnemy.wav      │ descent whoosh (enemy falling after
│
│                   │ hit)                                 │
├──────────────────────────────┼──────────────────────────────
──────────────────────────────┤
│ leafCollect.wav   │ riser wildfire (positive swell for   │
│                   │ collecting)                          │
├──────────────────────────────┼──────────────────────────────
──────────────────────────────┤
│ music.wav         │ drum loop (background music)         │
└──────────────────────────────┴──────────────────────────────
──────────────────────────────┘
```

Note: the current main.js is loading sounds directly from downloads/ rather than assets/sfx/. If you want the game to use these sfx files, you'll need to update those paths in main.js to point to assets/sfx/jump.wav, etc. Let me know if you'd like me to do that.

✻ Worked for 1m 31s

❯ yea do it man

⏺ Update(main.js)
└ Added 7 lines, removed 7 lines
138 // die → descent whoosh (falling/fading = death)
139 // leaf → riser wildfire (positive upward swell = collecting)
140 // win → riser wildfire (same positive feel for level completion)
141 - soundManager.load("jump", "downloads/viralau

```
-dio-ascent-braam-magma-brass-d-cinematic-trail
-er-sound-effect-222269.mp3");

+");
150
151    // --- Parallax layer defs (VIEW) ---
152    const defs = levelPkg.level?.view?.parallax
 ?? [];
```

🔶 Done. All audio paths now point to assets/sfx/. The die sound
reuses hitEnemy.wav (descent whoosh) and win reuses leafCollect.wav (riser), matching the original intent.

❯ replace the audio name with their original names dont use

	hitEnemy (like if it was descent whoosh just name it so) ⏺ Bash(cd /Users/giangtran/Documents/GitHub/ggiangt_sidequest_W6 /assets/sfx && mv jump.wav ascent-braam.wav && mv receiveDamage.wav stab.wav && mv hitEnemy.wav descent…) └ Done ⏺ Update(~/Documents/GitHub/ggiangt_sidequest_W6/main.js) └ Added 7 lines, removed 7 lines 138 // die → descent whoosh (falling/fading = death) 139 // leaf → riser wildfire (positive upward swell = collecting) 140 // win → riser wildfire (same positive feel for level completion) 141 - soundManager.load("jump", "assets/sfx/jump.wav"); 142 - soundManager.load("hurt", "assets/sfx/receiveDamage.wav"); 143 - soundManager.load("hit", "assets/sfx/hitEnemy.wav"); 144 - soundManager.load("die", "assets/sfx/hitEnemy.wav"); 145 - soundManager.load("leaf", "assets/sfx/leafCollect.wav"); 146 - soundManager.load("win", "assets/sfx/leafCollect.wav"); 141 + soundManager.load("jump", "assets/sfx/ascent+-braam.wav"); 142 + soundManager.load("hurt", "assets/sfx/stab.wav"); 143 + soundManager.load("hit", "assets/sfx/descent-whoosh.wav"); 144 + soundManager.load("die", "assets/sfx/descent-whoosh.wav"); 145 + soundManager.load("leaf", "assets/sfx/riser-wildfire.wav"); 146 + soundManager.load("win", "assets/sfx/riser-wildfire.wav"); 147

	148 // Background music: drum loop plays continu ously 149 - soundManager.loadMusic("assets/sfx/music.wav -"); 149 + soundManager.loadMusic("assets/sfx/drum-loop +.wav"); 150 151 // --- Parallax layer defs (VIEW) --- 152 const defs = levelPkg.level?.view?.parallax ?? []; ⏺ Done. Files renamed and paths updated: - ascent-braam.wav → jump - stab.wav → hurt - descent-whoosh.wav → hit / die - riser-wildfire.wav → leaf / win - drum-loop.wav → music
is this updated in all the other parts of the code that uses it as well?	Searched for 2 patterns (ctrl+o to expand) ⏺ All audio paths are only defined in main.js — nothing else in src/ or data/ references them. You're good.
